In recent years digital technologies have been increasingly used as an interface between the public on one hand and the museums on the other. Virtual museums and exhibitions are becoming part of our daily life permitting the citizens to have part on the historical and cultural heritage irrespective of distances.

Besides digital technologies offer a valuable tool for researchers to combine research efforts and interests in the study of cultural heritage. The Mongolian Academy of Sciences is starting a project for such a purpose. Within the framework of this project items of cultural heritage such as old texts, archeological artefacts etc. will be digitized and made through internet accessible to interested researchers from anywhere for collaborative work.
